

6. Frontend Development

ComicCraft Project Documentation

Purpose: Documents the HTML, CSS, and Jinja2 frontend development described in the ComicCraft project file.

6.1 Frontend Technology

The ComicCraft frontend uses HTML, CSS, and Jinja2 templates rendered through FastAPI. The documented interface is designed to provide a simple flow from prompt entry to comic preview and PDF export.

6.2 index.html

- Acts as the main entry point.
- Collects the story prompt.
- Collects the main character name.
- Collects the setting.
- Collects the story tone.
- Collects the preferred art style.
- Submits the form to /generate using POST.

6.3 comic_preview.html

The preview page displays the generated comic panel-by-panel.

- Panel number and title.
- AI-generated comic image.
- Scene description in italic text.
- Caption and narration.
- Image prompt reference.

The documented template uses Jinja2 iteration such as {% for panel in layout %} to display the generated layout.

6.4 export_success.html

This page confirms that the comic has been created and downloaded successfully. It provides a route back to the homepage so the user can create another comic.

6.5 Visual Design

- Scenic background image.
- Simple typography.
- Centered and organized form layout.
- Consistent button styling with hover effects.
- Padding, rounded corners, and box shadows for input and result panels.
- Light color scheme focused on readability.

6.6 Jinja2 Integration

```
from fastapi.templating import Jinja2Templates

templates = Jinja2Templates(directory="templates")
```

The documented route-to-template mapping is: / → index.html, /generate → comic_preview.html, and /export-success → export_success.html.

6.7 Frontend Flow

```
index.html
↓ POST /generate
comic_preview.html
↓ Download action
PDF export
↓
export_success.html
```
